

Rules

- [Overview](#)

Overview

Rules are a set of Constraints and/or Forced Interactions that can train your model to mandatory business rules you may want to include on your model outcome.

Types of Rules

Once the parameters are defined on the test model, Test Case Designer gives the flexibility to add an extra layer of rules on how those parameters will interact:

- **Constraints** - system allows the user to define what parameter values can never be tested together or, on the other hand, scenarios where parameter values can only be tested together.
For that, the user can apply constraints to support these cases.
- **Forced Interactions** - a method to train the model about specific business rules that must always be considered on the generated tests, as long as the required values and outcomes.
With Forced Interactions, the system will always ensure these interactions are added to your model output.

These options are available within the **Rules** section on the left menu:
