

# User Guide

Your daily testing activities will mostly be focused on two tasks: [writing/specifying](#) Tests and [organizing](#) them in Test Sets.

When you create Tests, you will also [associate](#) each Test to the requirement(s) it validates; this is essential for the requirement coverage calculation and all the reporting you will need afterwards.

Your [testing plan](#) may be more or less formal (see [Test Process](#)), but you will probably end up using Test Plans. By creating a Test Plan with all the relevant tests for your release, you will be able to immediately track the status of those tests and the associated requirements. From that Test Plan, you will [schedule, assign and execute tests](#) by creating one or more Test Executions. Some of those tests might fail, so you will end up creating new or cloning existing Test Execution(s) until you have all your requirements fully validated.

Xray provides [multiple ways to gather QA-related metrics](#) from your project, so that when you decide to release, it will be a substantiated decision.
