About the Robot Framework

The Robot Framework is a generic test automation framework for acceptance testing and acceptance test-driven development (ATDD).

It has easy-to-use tabular test data syntax and it uses the keyword-driven testing approach.

Robot Framework Concepts

The Robot Framework modular architecture can be extended with bundled and self-made test libraries.

A test suite consists of a file containing test cases. A directory containing these suite files creates a nested structure of test suites.

Robot is capable of generating a report for each execution in its specific XML format (xUnit) as well as HTML data formats.

The native Robot Framework's XML format has a well-defined schema and represents the pattern in which the framework executes the keywords given in that particular test suite.

Importing Robot Framework XML reports

Each Robot test case can be marked with a Tag identifying the requirement being tested; it also can be a Test definition already present in Jira. Tagging a requirement in a test case will create a link between the test case and the requirement. Identifying a test case with an issue key Tag, will create a test execution for the pre-existing Test (it does not create any new Test in this case).

It is important that the "Requirements issue types mapping" is configured at the point of import; otherwise, no link will be created. Refer to [Issue Type Mapping](#) for more information.

Below is a simplified example of a Robot Framework XML report. There are some nested test suites, and one failed test marked with Tags. The WEB-1 tag corresponds to an existing Story we want to test, while WEB-3 is the Test issue key which contains the test definition.

Robot-Framework example Suite and Test Case source file

```
*** Settings ***
Documentation      A test suite with a single Gherkin style test.
Library            BuiltIn
Library            Selenium2Library
Test Teardown      Close Browser

*** Variables ***
${SERVER}          localhost:8080
${BROWSER}         chrome
${DELAY}           0.5
${LOGIN URL}       http://${SERVER}/login.jsp
${WELCOME URL}     http://${SERVER}/secure/Dashboard.jsps

*** Test Cases ***
Gherkin Valid Login
    [Tags]          WEB-1  WEB-3
    Given browser is opened to login page
    When user "admin" logs in with password "password123"
    Then welcome page should be open

*** Keywords ***
Browser is opened to login page
    Open browser to login page

Open Browser To Login Page
    Open Browser    ${LOGIN URL}    ${BROWSER}
    Maximize Browser Window
    Set Selenium Speed    ${DELAY}
    Login Page Should Be Open

User "${username}" logs in with password "${password}"
    Input username    ${username}
    Input password    ${password}
    Submit credentials

Input Username
    [Arguments]       ${username}
    Input Text        login-form-username    ${username}

Input Password
    [Arguments]       ${password}
    Input Text        login-form-password    ${password}

Welcome Page Should Be Open
    Location Should Be    ${WELCOME URL}
    Title Should Be      System Dashboard - Your Company JIRA
```

</status>
</suite>
</robot>

```

Entities

Each Robot test case is mapped to a Generic Test in Jira, having the summary with the name of the test case, and the **Generic Test Definition** field contains the concatenated names of the test suites, along with the name of the test case. Note that the Robot Framework considers the base folder of the project as the first test suite.

Please note

The way you run your tests also affects Robot's XML, so if you execute the file from somewhere else or you directly execute the file by passing it as an argument, the test suite's information will potentially be different.

Test Type:Generic

Definition:Login Tests.Gherkin Login.Gherkin Valid Login

The name, error message, duration and status of Robot's keywords will be imported and stored in the test run results.

i

Note

The test case keywords and the test case setup/teardown keywords are individually imported; therefore, you can see their respective results.

The test suite setup/teardown keywords are not imported.

Information about each Robot keyword (i.e., step), along with the corresponding status, are displayed in the Context section of the Execution Details of the Generic Test.

The example below shows the execution details page of a Test containing both test keywords as well as the final test teardown keyword.

Execution Details

Results

Context	Error Message	Duration	Status
Given browser is opened to login page		11 sec	PASS
When user "admin" logs in with password "password123"		9 sec	PASS
Then welcome page should be open	Location should have been 'http://localhost:8080/secure/Dashboard.jspa' but was 'http://localhost:8080/login.jsp'	1 sec	FAIL
Close Browser		3 sec	PASS

Status

Robot Framework's test case status maps directly to Xray test run status FAIL and PASS.

Note: Test Cases with the status FAIL may have an error/failure message displayed in the Results section of the Test Run screen.

Working example

Please take a look at the tutorial [Testing using Robot Framework integration in Python or Java](#) for a more concrete end-to-end example.
