

# Exporting Cucumber Tests - REST

## Exporting Cucumber Tests

When exporting Cucumber *feature* files, the [Export Cucumber Features](#) rules are followed. The input for the export REST method is a String containing Jira issue keys separated by ";".

These keys must reference issues with the Xray issues types **Test**, **Test Set**, **Test Execution** or **Test Plan** or any issue type mapped to the Requirement issue type.

A mix of these issue types is supported. In the same export call, you can include keys from each of the above issue types. The service will build a set of Test issues based on these keys. This set will include all direct Tests issues and all Test issues associated with either Test Sets, Test Executions or Test Plans matched and all the tests for the requirements matched.

The reference to keys in Jira will be necessary for importing back the execution results to the respective Test and Test Execution issues.

Returns the generated *feature* file(s) for the Tests matched by the input "**keys**" or/and by the input "**filter**" and by the input "**fz**".

### Request

#### QUERY PARAMETERS

| parameter     | type    | description  |
|---------------|---------|--|
| <b>keys</b>   | String  | a String containing a list of issue keys separated by ";"                                      |
| <b>filter</b> | Integer | an Integer that represents the filter id   |
| <b>fz</b>     | Boolean | a Boolean that indicates if the export of single feature files has to be a compressed zip file |

**keys** and **filter** query parameters are optional if the other one provided but they can both be provided at the same time. **fz** query parameter is also optional and its default value is false.

#### Example Request

/rest/raven/1.0/export/test?keys=DEMO-6;DEMO-7

/rest/raven/1.0/export/test?filter=134

/rest/raven/1.0/export/test?keys=DEMO-6;DEMO-7&filter=134

/rest/raven/1.0/export/test?keys=DEMO-6&fz=true

## Responses

**200 OK** : **application/octet-stream** : Successful. A file will be downloaded with the generated *feature* files. If multiple *features* where generated the result is a compressed zip file. If it is just a single *feature* file and the query parameter fz is true, then the result is also a compressed file zip. Otherwise a plain text file will be downloaded.

**400 BAD\_REQUEST** : **text/plain** : No feature files where generated. Please check Jira log.

**401 UNAUTHORIZED** : **text/plain** : The Xray license is not valid.

**500 INTERNAL\_SERVER\_ERROR** : **text/plain** : An internal error occurred when generating the *feature* file(s).
