Enhanced querying with JQL

- Custom Fields and Entity Properties
  - Entity Properties
- JQL Functions

Custom Fields and Entity Properties

Xray provides several custom fields and entity properties.

Jira's entity properties provide the means to store key/value pairs on Jira entities, such as issues. Xray uses somes entity properties that can be queried using JQL.

Entity Properties

Entity Property	Issue Type	Description	Example(s)

testType	Test	The Test Type that characterizes the nature of the Test	`project = DEMO and issuetype = Test and testType = Manual`
			
			`project = DEMO and testType = Manual`

testEnvironments	Test Execution	The Test Environment(s) assigned to the Test Execution	`project = DEMO and issuetype = "Test Execution" and testEnvironments = Chrome`
			
			`project = DEMO and testEnvironments = Chrome`

JQL Functions

No specific JQL functions are provided, since Jira Cloud does not provide a mechanism to implement them.
