[Xray Server] When we want to import cucumber results and others informations.

This article will help to define a methodology when we want to import cucumber results and others informations such as Test Environments, Evidences and Comments.

Step-by-step guide

Do these procedures in two different phases:

1. Import the results with Cucumber JSON results Multipart
   Import two different JSON files: in the first one import the results and in the second one import the Test Environment informations.
2. Update the test run and add the remaining information (evidences and comments)
   After importing the results add the remaining information such as evidences and comments by using the Test Runs - Rest.

Link for related documentation

Check this documentation that has information about Import Execution Results using JSON Multipart.

Check this documentation that has information about update information for Test Runs.
