[Xray Server] After changing name of fixVersion, the Requirement Status is wrong.
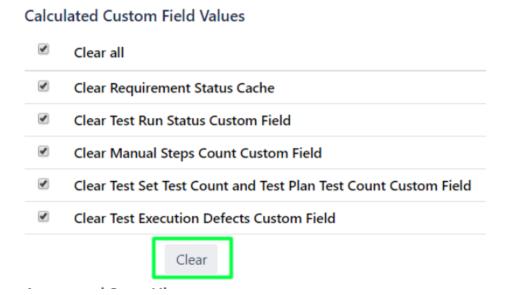

Internally, Xray data are directly associated with the version's names. Since the moment you change the version name, is needed to make a complete recalculation of the project as well as a re-index. Since these operations could be very heavy according to the size of the instance, Xray cannot do this operation automatically.
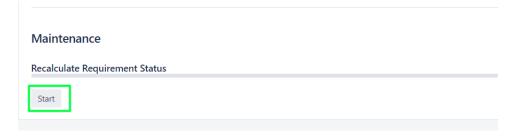

Solution

To solve this problem follow the steps described below:

⚠️ If you have a lot of Tests/Requirements, this could take some time to process. So we would advise running this when the Jira is in low usage.

- Go to Jira Administration >> Manage Apps >> Xray >> Integrity Checker and select these options:

- Then go to Go to Jira Administration >> Manage Apps >> Xray >>Custom fields and make a recalculation of Requirement Status.

- At last, make a re-index of your project.

After this, all the information of your project should be correct.
