Testing using Cucumber in Ruby/JRuby

Overview

In this tutorial, we will create some tests in Cucumber for Ruby (or JRuby).

The test (specification) is initially created in Jira as a Cucumber Test and afterwards, it is exported using the UI or the REST API.

Requirements

- Install Ruby or JRuby
- Install the "cucumber" gem

Description

After creating a Cucumber Test, of Cucumber Type "Scenario Outline", in Jira, you can export the specification of the test to a Cucumber .feature file via the REST API or the **Export to Cucumber** UI action from within the Test Execution issue.

The created file will be similar to the following:

1_CALC-889.feature

```
@REQ_CALC-889
Feature: As a user, I can calculate the sum of 2 numbers
```

```
@TEST_CALC-908 @UI @core
Scenario Outline: Cucumber Test As a user, I can calculate the sum of 2 numbers
                                           Given I have entered <input_1> into the calculator
                                           And I have entered <input_2> into the calculator
                                           When I press <button>
                                           Then the result should be <output> on the screen
                                             Examples:
                                              | input_1 | input_2 | button | output |
                                              20
                                                    | 30 | add | 50
                                              2
                                                       | 5
                                                                add
                                                                          7
                                                                         0
                                                       40
                                                                add
                                                                        40
                                                                                 50
                                                                add
                                                                        54
                                              4
```

After running the tests and generating the Cucumber JSON report (e.g., data.json), it can be imported to Xray via the REST API or the **Import Execution Results** action within the Test Execution.

cucumber -x -f json -o data.json

The execution screen details will not only provide information on the test run result, but also of each of the examples provided in the Scenario Outline.

The Cucumber Scenarios Example/Result details (i.e., Hooks, Backgrounds and Steps) are only available for executions done in Xray v2.2.0 and above.

Test Type: Scenario Type:	Cusumber Scenario Quilne					
Scenario:	1 Airee I have entered <input_3> into the calculator 2 And I have entered <input_3> into the calculator 3 When I press chuttons 4 Then the result should be coutputs on the screen 5 5 6 Examples: 7 input_1 input_2 button output 8 20 30 add 150 9 2 5 add 16 11 4 50 add 154</input_3></input_3>					

	<input_1></input_1>	<input_2></input_2>	<button></button>	<output></output>		Duration	Status
•	20	30	add	50		128 millisec	PASS
	Hooks						
	Before features/step_definitions/calculator_steps.rb:7					0 millisec	PASS
	After features/step_definitions/calculat	tor_steps.rb:11				0 millisec	PASS
	Background						
	Given a calculator I just turned on					126 millisec	PASS
	Steps						
	Given I have entered 20 into the calcu	lator				0 millisec	PASS
	And I have entered 30 into the calculate	tor			(2)	0 millisec	PASS
	When I press add					0 millisec	PA SS
	Then the result should be 50 on the so	creen			(2)	1 millisec	PASS
•	2	5	add	7		0 millisec	PASS
Þ	0	40	add	40		0 millisec	PASS
	4	50	add	54		1 millisec	PASS

1

(

The icon (2) represents the evidences ("embeddings") for each **Hook**, **Background** and **Steps**, but is only available for executions done in Xray v2.3.0 and above.
