

Document Custom Properties

Document Generator also provides a way to set **Document Custom Properties** with values from the issue fields, which can be useful when implementing VBA scripts based on issue field values.

Just open and add advanced custom properties to your template document, making use of the notations provided in the [Mappings](#) section. The value of the custom properties is not important since it will be overridden during the export process.

Example:

ProjectNameaa Properties

General Summary Statistics Contents Custom

Name:
Client
Date completed
Department
Destination
Disposition

Add
Delete

Type: Text

Value: ☐ Link to content

Name	Value	Type
Key	\${Key}	Text
Summary	\${Summary}	Text
Description	\${Description}	Text

OK Cancel

Once documents based on this template are exported, the advanced custom properties values will be set to the contents of the matching issue fields.
